

# Proposed Changes to NNC Implementation Document

(continued)

## Section 12.1.2 – Geomorphology as an Indicator

- Text describes HBG as hierarchical 4-step process (see next slide) that breaks streams out by regions and classes (karst, highlands, flatwoods)
- Lists regions and provides a map
- Describes how soils are used to determine stream class using GIS layers
- Describes flow characteristics of each class in each region
- Summarizes perenniality info in table – note that only non-perennial streams clearly meet stream exclusion
  - If seasonally non-perennial, need biology or flow data
