

How It Works

Water First North Florida uses proven technology being successfully used across Florida:

1. **Advanced Treatment**— Recycled water is highly treated at a water reclamation facility
2. **Natural Filtration**— Water undergoes additional natural filtering through constructed wetlands
3. **Quality Assurance**— Meets high water quality standards and is regularly tested and monitored
4. **Aquifer Recharge**— Clean water replenishes the Floridan Aquifer, restoring natural flows to our springs and rivers

This process eliminates non-beneficial surface water discharge while putting clean water back into the ground in a smart, natural way.

Where will it be located?
